PASSING INFORMATION BY POSITIONAL ARGUMENTS

In [55]:
```
#   there are two type of functions
#1     parameter less function
#2     parameterized function
```

Parameter less Function

In [56]:
```
#     def       is a key-word
#     function name
#      bracket  or parenthysis
#     colon
```

In [58]:
```
#   def add_number():    #  if parenthysis is empty ,its mean that
                      #   it is a parameter less function
```

PARAMETERIZED FUNCTION

In [59]:
```
def add_numbers(num1, num2):
                            #     variables name or value in parenthysis are c
known as PARAMETERS
    print(num1+num2)
```

In [61]:
```
add_numbers(3, 9)
```

```
12
```

In [62]:
```
add_numbers(83,91)            #  Function call ,in parenthesis value are know
ns as ARGUMENTS
```

```
174
```

In [63]:
```
def sub(num1, num2):

    print(num1-num2)
```

In [64]:
```
sub(200,100)
```

```
100
```

In [65]:
```
sub(200,300)              # these are positional arguments
                          #   num1 = 200
                         #    num2  = 300
```

```
